

As the global economy recognizes a serious threat from terrorism, data pilferage, and even sabotage, the need for secure and reliable service delivery has never been higher. Businesses, customers and individuals, have all been plagued with the fear of privacy violation and other monetary as well as reputational losses.

However, these trying times also pose a fantastic opportunity. If customers can identify with a reliable and secure service, a business can significantly increase loyalty and build a sustainable advantage that will be difficult to beat any other way.

Enhanced security in the client-server, and web based applications has always been high priority for an organization. Today it has assumed even greater significance due to dependence on the internet and many other communication tools. Customers are also more aware of the risks involved in harnessing insecure applications or products and therefore naturally tend to be loyal towards trusted services.

MindTree brings with it years of experience, and the expertise to secure any application or product from current and future vulnerabilities. With a focused research team having in-depth proficiency in Security Testing, MindTree is the right partner to help identify and address security concerns across any industry.

Our security testing services ensure:

- Applications are secure against known and unknown vulnerabilities
- Application data is secure and hack proof
- Applications are compliant with all security regulations

What's on your mind?

Are you confident that your applications are 100% secure?

Are you using the right tool to accelerate your security testing process?

Are you prepared for future security vulnerabilities?

Security Testing Offerings

MindTree provides end-to-end security testing services that covers all web and client-server applications. Four sub-services are offered to meet your short-term and long-term security needs.

Security Testing Methodology

MindTree's systematic security testing methodology deals with the following security threats to ensure that mitigation techniques work as expected:

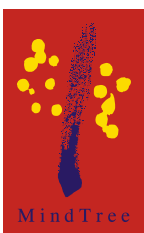

- Identity spoofing
- Data tampering
- Illegal access
- Service attacks
- Buffer overruns

MindTree Differentiators

- Partnered with some of the industry's best security solutions providers
- Proprietary tools to accelerate processes and increase security coverage
- Experts to audit application design and recommend updates for improved security
- Knowledgebase of domain specific vulnerabilities and threats
- Offerings backed by dedicated business units of independent testing and infrastructure management services

MindTree Customer Success Stories

- Appscan Certification and compliance for a expense management solution
- PCI compliance testing for a leading online sales application
- Certifying the application against OWASP vulnerabilities for a leading document sharing company
